Known finite-cohort loss

HLM 929 and RLM 922
Fixed RF and XGB predictors
Previously measured labels only

Selective references

Original MCAR / MAR
Molecular-weight selection
Probability alignment controls

Risk estimation

Complete case, HT and Hajek
AIPW with fitted or oracle p
Low, raw and processed loss

$$\psi_i = (1 - R_i/\hat{p}_i)\hat{m}_i + R_i L_i/\hat{p}_i$$

Reference absent R = 0
Predicted loss enters with coefficient 1

Reference observed R = 1
Coefficient 1 - 1/p need not be zero

Separate absolute accuracy, benefit over complete cases, and the uncertainty target
